

# Queensland Tide Tables

*Standard Port Tide Times*

2025

## Includes:

- Highest tides for the year
- Tidal notes and definitions
- Tidal datum details
- Tidal planes
- Sun and moon tables

## Copyright and disclaimer

Tide station data for tide predictions is collected by the Department of Transport and Main Roads (Maritime Safety Queensland); Queensland port authorities and corporations; the Department of Environment, Science and Innovation; the Australian Maritime Safety Authority (Leggatt Island) and the Australian Hydrographic Service (Bugatti Reef).

The Queensland Tide Tables publication is comprised of tide prediction tables from the Bureau of Meteorology and additional information provided by Maritime Safety Queensland. The tidal prediction tables are provided by the National Tidal Centre, Bureau of Meteorology. Copyright of the tidal prediction tables is vested in the Commonwealth of Australia represented by the National Tidal Centre, Bureau of Meteorology.

The Bureau of Meteorology gives no warranty of any kind whether express, implied, statutory or otherwise in respect to the availability, accuracy, currency, completeness, quality or reliability of the information or that the information will be fit for any particular purpose or will not infringe any third party Intellectual Property rights. The Bureau's liability for any loss, damage, cost or expense resulting from use of, or reliance on, the information is entirely excluded.

Information in addition to the tide prediction tables is provided by the Department of Transport and Main Roads (Maritime Safety Queensland).

The Department of Transport and Main Roads gives no warranty of any kind whether express, implied, statutory or otherwise in respect to the availability, accuracy, currency, completeness, quality or reliability of the information or that the information will be fit for any particular purpose or will not infringe any third party Intellectual Property rights. The Department of Transport and Main Roads liability for any loss, damage, cost or expense resulting from use of, or reliance on, the information is entirely excluded.

## **Conditions for reproducing the Queensland Tide Tables**

The Queensland Tide Tables publication is comprised of tide prediction tables from the Bureau of Meteorology and additional information provided by Maritime Safety Queensland. To publish or create new products, you must apply the following conditions.

### **For the Queensland Tide Tables publication**

You may freely publish, reproduce, add to or repackage in part or in whole, for private or commercial purposes, the Queensland Tide Tables publication provided that you include in any whole or part, the copyright, acknowledgements and disclaimers found on the inside cover of the Queensland Tide Tables.

### **For individual tide prediction tables**

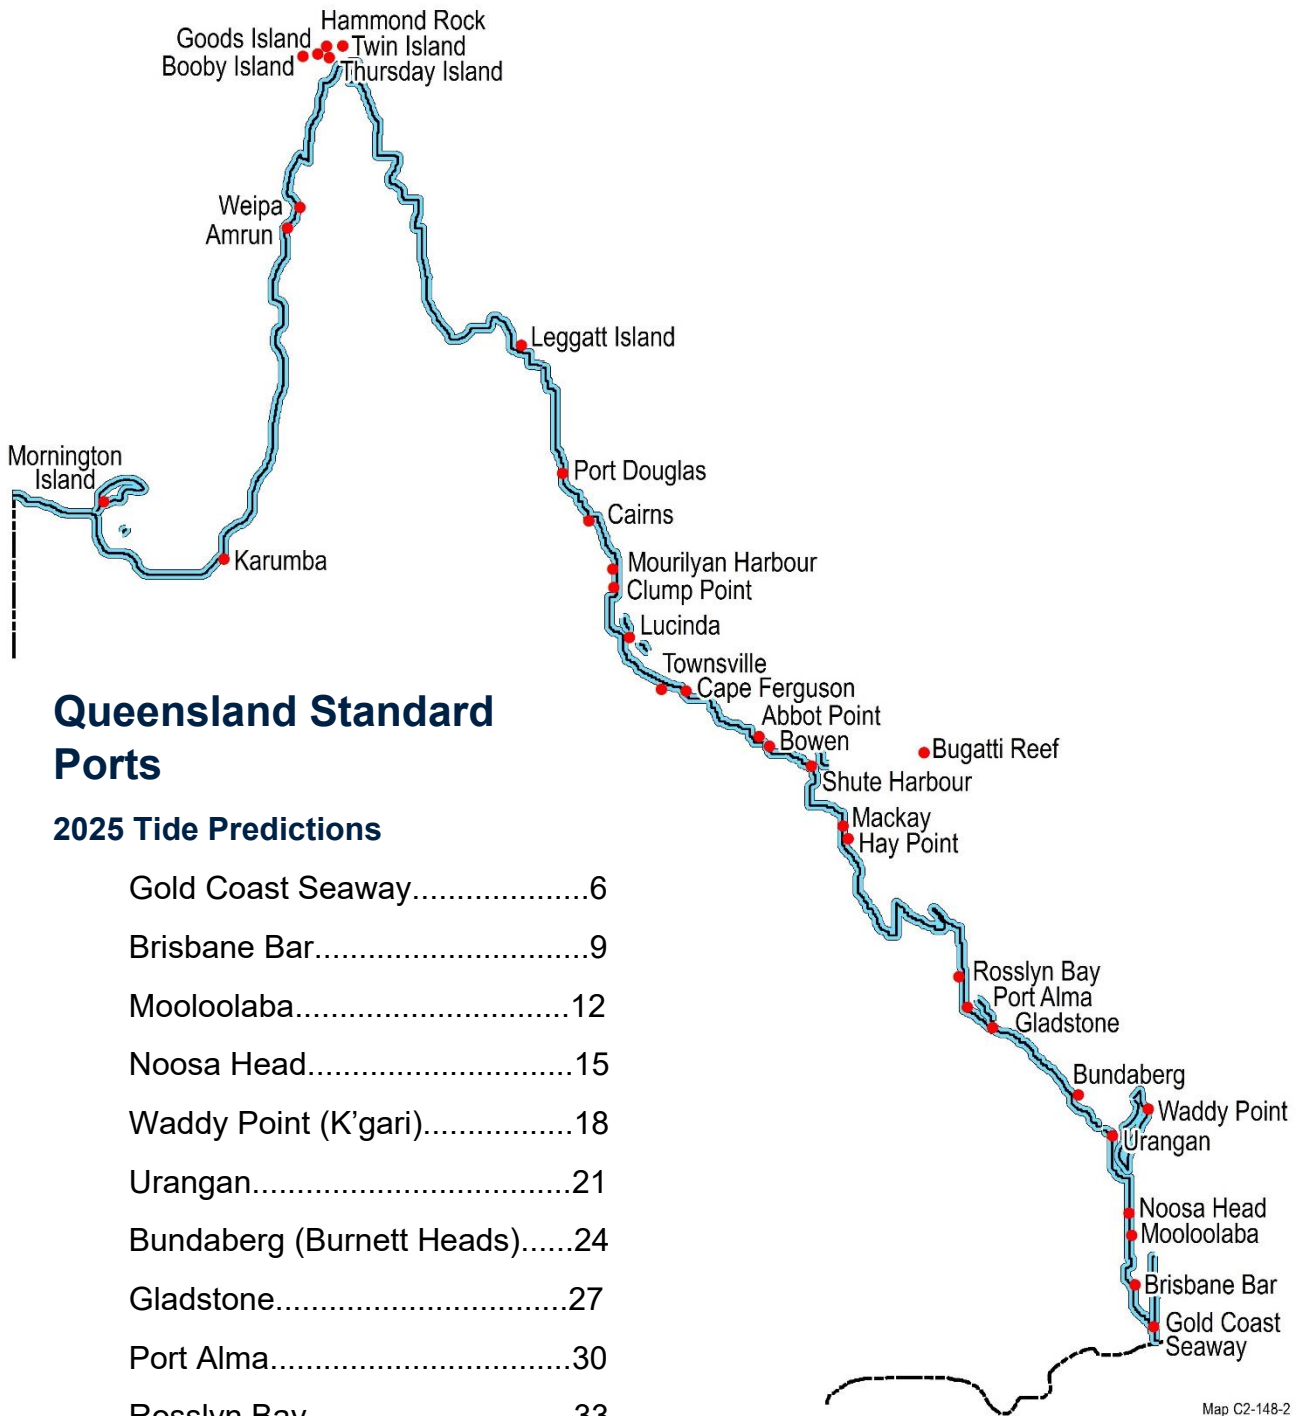

To publish or create new products of only individual tide prediction tables within the Queensland Tide Tables (or within any of the downloads available on this page) you must follow the "Conditions of Use" for acknowledgment, copyright and disclaimers as shown on the Bureau of Meteorology website:

<http://www.bom.gov.au/oceanography/projects/ntc/ntc.shtml>

### **For information other than tide prediction tables**

To individually publish information shown in the Queensland Tide Tables other than individual tide prediction tables, you must acknowledge the Department of Transport and Main Roads (Maritime Safety Queensland) and also show the following disclaimer:

The Department of Transport and Main Roads gives no warranty of any kind whether express, implied, statutory or otherwise in respect to the availability, accuracy, currency, completeness, quality or reliability of the information or that the information will be fit for any particular purpose or will not infringe any third party Intellectual Property rights. The Department of Transport and Main Roads liability for any loss, damage, cost or expense resulting from use of, or reliance on, the information is entirely excluded.

Mornington Island HAT 3.95m	13/01/2025 20:32 3.87m	

The highest tides listed - often referred to as king tides - are the highest spring tides that occur during summer and winter. Boat owners and people living along the waterfront should be vigilant at the times of these highest tides particularly in the summer, as storms and cyclones may elevate tidal levels significantly above the predicted tide heights.

# Mean sea level used for the tidal predictions – 2025

An allowance of 2.7mm per year for sea level change has been made in the mean sea level (MSL) estimate. The allowance is calculated from the central date of the observation period to the central date of the prediction year. The heights are referred to Queensland Port Datum.

Place	Observation Period	MSL
Gold Coast Seaway	Jul 2016 to Dec 2023	0.892
Brisbane Bar	Jan 1985 to Dec 2022	1.345
Mooloolaba	Jan 1987 to Dec 2022	1.020
Noosa Head	Dec 1970 to Dec 1971	1.182
Waddy Point (K'gari)	Oct 1976 to Feb 1978	1.204
Urangan	Sep 1986 to Dec 2022	2.156
Bundaberg (Burnett Heads)	Jan 1985 to Dec 2022	1.801
Gladstone	Jan 1985 to Dec 2022	2.414
Port Alma	Jan 1986 to Dec 2022	2.974
Rossllyn Bay	Jan 1993 to Dec 2022	2.501
Hay Point	Jan 1985 to Dec 2022	3.447
Mackay Outer Harbour	Jan 1985 to Dec 2022	3.089
Bugatti Reef	Oct 1996 to Mar 1997	1.621
Shute Harbour	Jan 1987 to Mar 2018	1.986

# Tidal notes

## Tidal datum epoch

The tidal datum epoch is the recommended interval for the calculation of tidal datums. Australian tidal authorities have adopted the 20 year Tidal Datum Epoch 1992 to 2011 (inclusive) as the basis for determining Lowest Astronomical Tide (LAT) datum. This Tidal Datum Epoch is known as LAT(1992). Queensland has moved to a Tidal Datum Epoch 2010 to 2029 (inclusive) for tidal plane determination excluding LAT.

In the 2022 edition the standard ports' semidiurnal and diurnal tidal planes were updated to incorporate the latest available tidal observations, prediction information and allowance for sea level rise, i.e. they have been determined using Tidal Datum Epoch 2010 to 2029 and given as heights above the Queensland Port Datum (LAT(1992)). It is intended that the 2022 tidal plane values will now remain fixed until the tidal datum epoch is reviewed or significant changes occur.

The mean sea levels listed in the table 'Mean Sea Level Used for the Tidal Predictions' will change over the course of the tidal datum epoch as they include the most recent observations and an allowance for sea level rise.

## Datum of tidal heights

The height of the tide (expressed as metres and decimals) is referred to the port datum (LAT datum). When a low water falls below datum, it is marked with a minus sign (-).

When utilising a navigational chart, tidal height should be added to chart depth. If preceded by a minus sign, it should be subtracted.

## Standard port

Standard ports are those provided as daily tables of the predicted times and heights of high and low waters. The tide times are referred to Australian Eastern Standard Time and the tide heights are referred to LAT datum.

## Secondary places

Secondary places are those for which daily predictions are not provided in the Queensland Tide Tables. These locations are grouped and associated to the adjacent standard port with a similar tidal pattern. Data sufficient for calculating their times and heights is supplied following the standard port prediction tables.

## **Tidal Levels**

A list of tidal levels referred to Queensland Port Datum for standard ports and selected secondary places is given in the following tables:

- Semidiurnal Tidal Planes
- Diurnal Tidal Planes

In addition, the tables for semidiurnal and diurnal tidal planes provide the factors necessary to calculate tidal predictions at the selected secondary places (referred to Queensland Port Datum at each secondary place) from the tidal predictions of the standard ports.

## **Rise**

The rise of the tide is the height of the high water above port datum.

## **Range**

The range of the tide is the difference between the height of high water and the next succeeding or last preceding low water.

## **Semidiurnal tide**

Semidiurnal tide refers to a tide which has a period or cycle of approximately half of one tidal day (about 12.5 hours). Semidiurnal tides usually have two high and two low tides each day. The tides at Brisbane Bar are a typical example of semidiurnal tides.

## **Diurnal tide**

Diurnal tide refers to a tide which has a period or cycle of approximately one tidal day (about 25 hours). Diurnal tides usually have one high and one low tide each day. The tides at Karumba are a typical example of diurnal tides.

## **Highest tides for year**

King tide is a non-scientific term, but the popular concept is that it is the higher high waters which occur around Christmas time. Equally high tides occur in the winter months during the night.

### **Meteorological effects on tides**

Meteorological conditions which differ significantly from the seasonal averages, will cause corresponding differences between the predicted and the actual tide.

Variations in tidal heights are mainly caused by strong or prolonged winds and by unusually high or low barometric pressure. Tidal predictions are computed for average barometric pressure.

Low pressure systems tend to raise sea levels, and high pressure systems tend to lower them. However, the water does not adjust itself immediately to a change of pressure, but responds to the average change in pressure over a considerable area.

The effect of wind on sea level, and therefore on tidal heights and times, is variable and depends on the topography of the area in question. In general, it can be said that wind will raise the sea level in the direction towards which it is blowing. A strong wind blowing straight onshore will cause the water to "pile up" resulting in high waters to be higher than predicted. Winds blowing off the land will have the reverse effect.

# Tidal definitions

## **LAT (lowest astronomical tide) and HAT (highest astronomical tide)**

These are the lowest and highest levels which can be predicted to occur under average meteorological conditions and any combination of astronomical conditions.

In Queensland, HAT is calculated as the highest level from tide predictions over the tidal datum epoch (TDE), which is currently set to 2010 to 2029.

These levels will not be reached every year. LAT and HAT are not the extreme levels which can be reached, as storm surges may cause considerably lower and higher levels to occur.

LAT(1992) has been used as port and chart datum since 1994.

## **MSL (mean sea-level)**

The mean level of the sea over a long period (preferably 18.6 years) or the mean level which would exist in the absence of tides.

## **AHD (Australian height datum)**

This datum has been adopted by the National Mapping Council as the datum to which all vertical control for land-based mapping is to be referred.

## **MHWS (mean high water springs)**

The long term mean of the heights of two successive high waters during those periods of 24 hours (approximately once a fortnight) when the range of tide is greatest during the full and new moon.

## **MLWS (mean low water springs)**

The long term mean of the heights of two successive low waters over the same periods as defined for MHWS.

## **MHWN (mean high water neaps)**

The long term mean of the heights of two successive high waters when the range of tide is the least at the time of first and last quarter of the moon.

**MLWN (mean low water neaps)**

The long term mean of the heights of two successive low waters over the same periods as defined for MHWN.

**MHHW (mean higher high water)**

The mean of the higher of the two daily high waters over a long period of time. When only one high water occurs on a day, this is taken as the higher high water.

**MLHW (mean lower high water)**

The mean of the lower of the two daily high waters over a long period of time. When only one high water occurs on most days, no value is printed in the MLHW column, indicating that the tide is usually diurnal.

**MHLW (mean higher low water)**

The mean of the higher of the two daily low waters over a long period of time. When only one low water occurs on most days, no value is printed in the MHLW column, indicating that the tide is usually diurnal.

**MLLW (mean lower low water)**

The mean of the lower of the daily low waters over a long period of time. When only one low water occurs a day, this is taken as the lower low water.

**MHW (mean high water)**

The mean of all high waters observed over a sufficiently long period (preferably over the current tidal datum epoch).

For those stations with shorter series, simultaneous observational comparisons are made with a control tide station in order to derive the equivalent datum.

**MLW (mean low water)**

The mean of all low waters observed over a sufficiently long period (preferably over the current tidal datum epoch).

For those stations with shorter series, simultaneous observational comparisons are made with a control tide station in order to derive the equivalent datum.

**QPD (Queensland Port Datum)**

Queensland Port Datum has typically been defined by LAT(1992) since 1994.

### **LWD (Low Water Datum)**

The mean height of the lower low waters at springs.

This was a local plane which usually satisfied the criterion that the tide seldom fell below it.

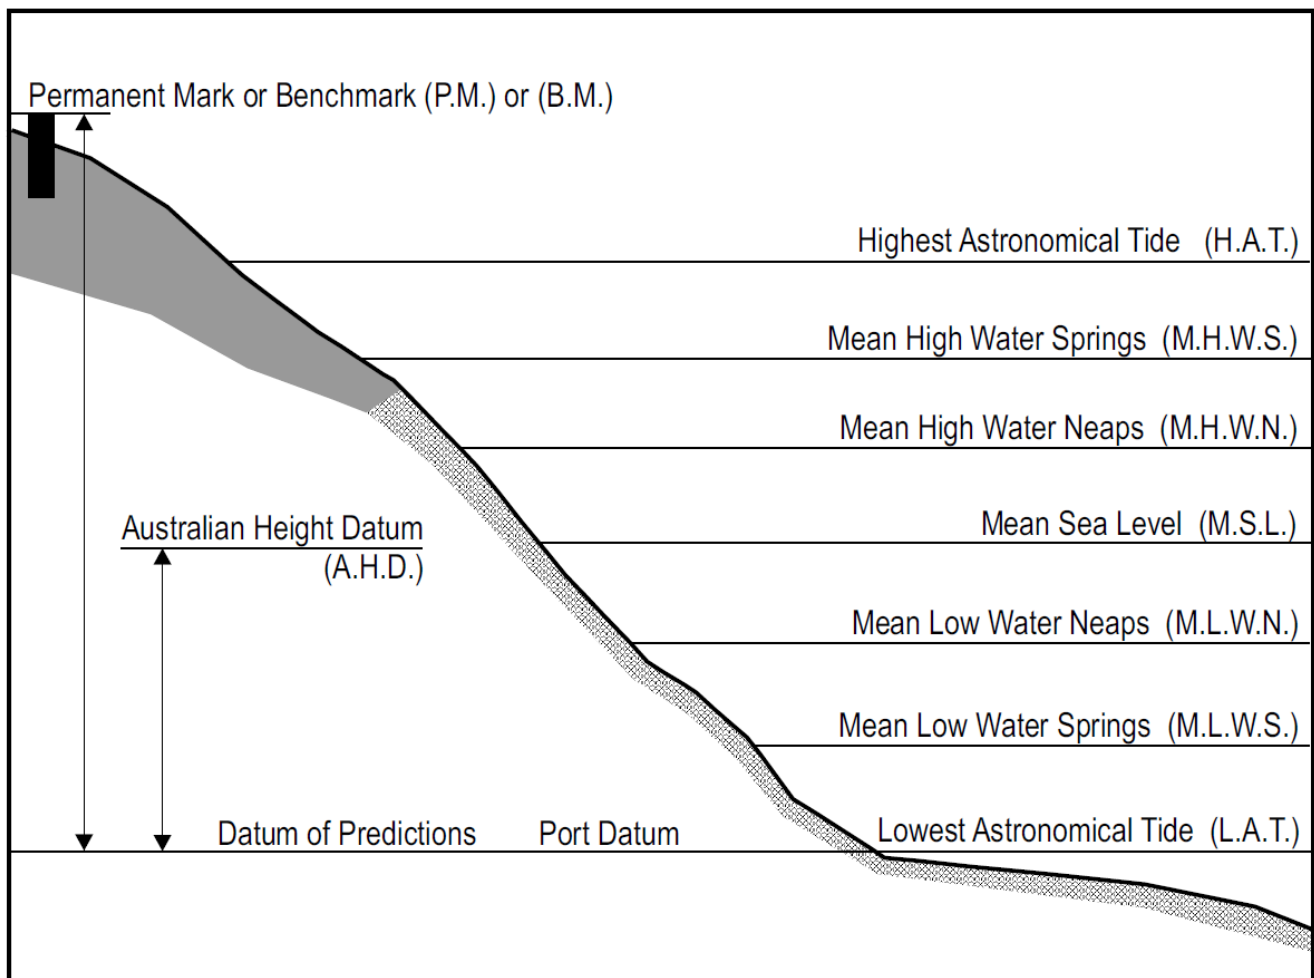

In the past, this was generally chosen for port and chart datum in Queensland waters however it was superseded by QPD in 1994.

# Guide to tidal planes

## Tidal datum epoch

The Queensland standard ports' semidiurnal and diurnal tidal planes were updated for the current tidal datum epoch 2010 – 2029, using the latest available tidal observations, prediction information and allowance for sea level rise. It is intended to maintain the standard port datum planes until an official review highlights the need for an update to the epoch. The secondary place tidal planes have also been updated to match the new values adopted at the standard ports.

\*\* Tidal planes determined through non-linear tidal transfer.

\*\*\* Tidal planes determined via harmonic analysis

# Tide calculations for places other than standard ports

Find the required locality in the Semidiurnal Tidal Planes table or the Diurnal Tidal Planes table and note its standard port.

## Time of High Water

1. Note the time difference in column 1;
2. Add or subtract (as indicated by + or -) this time difference to the predicted time of high water at the standard port.

## Time of Low Water

1. Note the time difference in column 2;
2. Add or subtract (as indicated by + or -) this time difference to the predicted time of low water at the standard port.

The result is the approximate time of the tide at the required locality.

## Height of High Water

1. Find the height of the predicted high water at the standard port;
2. Multiply the height by the ratio in column 8;
3. Add or subtract (as indicated by the + or -) the constant in column 9.

## Height of Low Water

1. Find the height of the predicted low water at the standard port;
2. Multiply the height by the ratio in column 8;
3. Add or subtract (as indicated by the + or -) the constant in column 9.

The result is the approximate height of tide at the required locality.

# Example calculations

## Important information for finding tide times

Extract from the table Semidiurnal Tidal Planes

Height above Queensland Port Datum (LAT(1992)) table

Place	Latitude South	Longitude East	Time Difference		MHWS	MHWN	MLWN	MLWS	MSL	Ratio	Cons	HAT
			HW	LW								
Tidal Datum Epoch 2010-2029			1	2	3	4	5	6	7	8	9	10
			H M	H M	m	m	m	m	m		m	m
<b>Standard</b>	<b>27 22</b>	<b>153 10</b>	<b>Standard Port</b>		<b>2.22</b>	<b>1.84</b>	<b>0.81</b>	<b>0.42</b>	<b>1.32</b>	<b>1.00</b>	<b>0.00</b>	<b>2.78</b>

### Tide times for March 16 2022 at the standard port

Time	Metres
02:09	0.56
08:29	2.39
15:04	0.60
20:44	2.00

### Secondary place differences to standard port

Time	Metres
Time difference high water (Column 1)	-0 25
Time difference high water (Column 2)	-0 30
Ratio (Column 8)	0.81
Constant (Column 9)	+0.00

# Example calculation of time and height of high and low water at a secondary location

## Predicted high water at secondary place calculations

Predicted high water at standard port	2.39 m at 08:29
Time of high water at secondary place	= 08:29 – 25 minutes
	= 8:04
Height of high water at secondary place	= (2.39 x 0.81) + 0.00
	= 1.94 + 0.00
	= 1.94 m

The first high water at the secondary place on 16 March 2022 is predicted to occur at 08:04 and reach a height of 1.94m above Queensland Port Datum (LAT(1992)).

## Predicted low water at secondary place calculations

Predicted low water at standard port	0.56 m at 02:09
Time of low water at secondary place	= 02:09 – 30 minutes
	= 01:39
Height of low water at secondary place	= (0.56 x 0.81) + 0.00
	= 0.45 + 0.00
	= 0.45 m

The first low water at the secondary place on 16 March 2022 is predicted to occur at 01:39 and reach a height of 0.45m above Queensland Port Datum (LAT(1992)).

## Example calculation of tide height between high and low water

Find the height of high and low tide at the Standard port and secondary place at 6:40am on March 16 2022.

### Standard port calculation

1. Obtain the tidal predications from the tables at the Standard Port.

Refer to tide times for March 16 2022 at the standard port within the [important information for finding tide times section](#).

2. Calculate the height difference.

Measurement	Metres
High water	2.39
Low water	- 0.56
Range (height difference)	1.83

3. Refer to the appropriate Standard Tidal Curves (or interpolated graph) for the tidal range.

If the required time is 06:40 hours or 6:40 am (1 hour and 49 minutes before high water), we will use the range from step 2 to calculate the movement of a tide over a complete tidal cycle.

Using the 1.83m range to 1 hour 49 minutes before high water, you read the height at this point as 1.6m.

4. Add the height obtained in step 3 to the height of low water at the standard port.

Measurement	Metres
Low water	0.56
Tidal curves	+ 1.60
Tidal height	2.16

At 6:40 am Wednesday 16 March 2022 the tide at the standard port was approximately 2.16m.

## Secondary place calculation

1. Calculate the high and low water times and the heights for the secondary place.

Time	Metres
01:39	0.45
08:04	1.94

2. Calculate the height difference.

Measurement	Metres
High water	1.94
Low water	- 0.45
<b>Range (height difference)</b>	<b>1.49</b>

3. Refer to the appropriate Standard Tidal Curves (or interpolated graph) for the tidal range.

If the required time is 06:40 hours or 6:40 am (1 hour and 24 minutes before high water), we will use the range from step 2 to calculate the movement of the tide over a complete tidal cycle.

Using the 1.49m range to 1 hour 24 minutes before high water, you read the height at this point as 1.3m.

4. Add the height obtained in step 3 to the height of low water at the secondary place.

Measurement	Metres
Low water	0.45
Tidal curves	+ 1.30
<b>Tidal height</b>	<b>1.75</b>

At 6:40 am Wednesday 16 March 2022 the tide at the secondary place was approximately 1.75m.

# Standard tidal curves

## Standard Tidal Curves - Tide Ranges up to 3m

## Standard Tidal Curves - Tide Ranges up to 6m

# Calculation of overhead clearance

The semidiurnal and diurnal tidal planes information has been updated based on the Epoch 2010 - 2029.

At some localities, this had a minor impact on the highest astronomical tide values. The clearance value assigned to overhead structures across tidal waters is being reviewed.

Mariners are advised to refer to the Beacon to Beacon Directory and the respective management authority signage for warnings and clearance information.

Highest astronomical tide values for standard ports and secondary locations are tabulated under Semidiurnal Tidal Planes and Diurnal Tidal Planes.

## Overhead clearance

This is defined as the vertical distance between the lowest under-surface of the overhead structure and the water level at the highest astronomical tide.

For electricity cables, this also incorporates an additional mandatory safety margin to satisfy electrical regulations. The difference in elevation between the highest astronomical tide value and the predicted tide height at the time of passing under the structure, can be added to the nominated minimum clearance shown on the chart/directory so as to derive the total clearance available.

A further safety margin should be included to provide a guaranteed air space above the uppermost part of the vessel and the undersurface of the overhead structure, therefore further reducing available overhead clearance.

Weather conditions, storm surge, flood runoff, current, wave action or wash from other vessels should be considered as factors that can cause an additional reduction of your calculated clearance.

Consult your chart first, the deepest part of a channel may not occur at the maximum point of clearance.

To ensure the safety of your vessel and persons onboard, know the maximum height of your vessel above the waterline, its maximum draught, always keep a proper lookout, and navigate beneath the overhead structure at an appropriate speed.

## Bridges and overhead pipelines

The value shown is the maximum clearance above HAT (highest astronomical tide).

For a bridge that slopes continuously downwards from one bank to the other, the clearance value shown is for the position beneath the lowest part of the span.

In all instances, the deepest part of the navigation channel may not occur at the point of maximum clearance.

## Overhead cable clearance

The value shown indicates the maximum height of a vessel which may pass beneath the cable and are given for the lowest point of the sag. Allowances have been made for safety margins required to satisfy the electricity regulations. Clearances are given with respect to HAT. The deepest part of the navigation channel may not occur at the point of maximum clearance.

Boat operators should always be responsible for maintaining a proper lookout at all times for crossings which may not be shown on the chart or those which have altered in some way.

**No anchoring zone** - a vessel must not be anchored within 50 metres of an underwater cable or pipeline that is accompanied by warning signage from the management authority.

Note - it is prohibited to anchor, berth, moor or operate a vessel within 100 metres of a dam wall, spillway or weir; or near infrastructure nominated by the management authority.

### Flood debris warning

Mariners are advised that the safest areas are in the middle third of the waterway. Known submerged hazards adjacent to the banks have been found by survey (March - June 2011). Hazards can move. Navigate carefully.

The moon phases given in this table are the times when the sun, moon, and earth lie approximately in the same line (180°) at full and new moon and at first and last quarter when the moon is (90°) to the line of the sun and earth.

Times are Australian Eastern Standard Time.

## 2025 Seasons and apsides of the earth

<b>Perihelion</b> d h m	<b>Vernal Equinox</b> d h m	<b>Summer Solstice</b> d h m	<b>Aphelion</b> d h m	<b>Autumnal Equinox</b> d h m	<b>Winter Solstice</b> d h m

Equinox and Solstice named by Northern Hemisphere convention.

Times are Australian Eastern Standard Time.

## Using the moonrise and moonset table

The average time between the rising and setting of the moon is 12 hours 25 minutes. It follows that successive rises (or sets) of the moon will be 24 hours and 50 minutes apart or in other words the moon will rise (or set) on average 50 minutes later each successive day of the year.

As a consequence of the above – unlike the sun which always rises in the morning and sets in the afternoon of the same day – the moon will frequently set on the day after it has risen.

Occasionally there is no entry in the table for the moon set time, this means that the moon will set on the next day.

Occasionally there is no entry in the table for the moonrise time, this means the moon rose on the previous day.

# Sun and moon rise and set tables

The tables of moon and sun rise and set have been prepared by Maritime Safety Queensland using information from Geoscience Australia. The tables detail the times of the rise and set phenomena for an observer at sea level for the following tidal stations:

- Brisbane Bar
- Gladstone
- Mackay Outer Harbour
- Townsville
- Cairns
- Karumba
- Weipa

The time of the rise and set varies from place to place. However for adjacent places the variation is small and as a result the entries in the table may be used for adjacent tidal stations.

The times of moon rise and set are given for every day of the month. The times of sunrise and set are given for every 5th day of the month.

The following groupings are applicable:

Brisbane representing	Gold Coast Seaway, Brisbane Bar and Mooloolaba.
Gladstone representing	Bundaberg, Gladstone, Port Alma and Rossllyn Bay.
Mackay representing	Hay Point, Mackay, Shute Harbour, Bowen and Abbot Point.
Townsville representing	Townsville and Lucinda.
Cairns representing	Mourilyan, Cairns and Port Douglas.
Karumba representing	Karumba and Mornington Island.
Weipa representing	Weipa and Thursday Island.

It should be noted that:

- the grouping introduces an approximation which does not exceed 10 minutes;
- the grouping introduces atmospheric refraction that is different from the standard refraction; and,
- the height of eye of the observer (above sea level), will affect the time at which the sun and moon appear to rise and set.

Definitions:

- **Sun rise** is defined as the instant in the morning under ideal meteorological conditions, with standard refraction of the sun's rays, when the upper edge of the sun's disk is coincident with an ideal horizon.
- **Sun set** is defined as the instant in the evening under ideal meteorological conditions, with standard refraction of the sun's rays, when the upper edge of the sun's disk is coincident with an ideal horizon.
- **Moon rise** is defined as the instant when, in the eastern sky, under ideal meteorological conditions, with standard refraction of the moon's rays, the upper edge of the moon's disk is coincident with an ideal horizon.
- **Moon set** is defined as the instant when, in the western sky, under ideal meteorological conditions, with standard refraction of the moon's rays, the upper edge of the moon's disk is coincident with an ideal horizon.

An ideal horizon exists when the surface forming the horizon is at a right angle to the vertical line passing through the observer's position on the earth. If the terrain surrounding the observer was flat and all at the same height above sea level, the horizon seen by the observer standing on the earth would approximate the ideal horizon.
